    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ••

; Sequence 5, Application US/08448606
; Patent No. 5721114
; GENERAL IMPORMATION:
APPLICANT: Abrahams n, Lars
APPLICANT: Holmgren, Erik
APPLICANT: Kalder n, Christina
APPLICANT: Kalder n, Christina
APPLICANT: Mikaelsson, sa
APPLICANT: Sejlitz, Torsten
APPLICANT: Sejlitz, Torsten
 CLASSIFICATION: 436
PRIOR APPLICATION DATA:
APPLICATION NUMBER: PCT/SE93/.
FILING DATE: 09-DCC-1993
PRIOR APPLICATION NUMBER: SE 920375:
APPLICATION NUMBER: SE 920375:
PLING DATE: 11-DCC-1992
PTIORNEY/AGENT INFORMATION:
NAME: Amernick, Burton A.
REGISTRATION NUMBER: 24,852
REFERENCE/DCKET NUMBER: 0151.
TELEPHONE: (202)331-7111
TELEPHONE: (202)331-7111
TELEPHONE: (202)331-7111
TELEPHONE: (202)331-715.
 TELEFAX: (
INFORMATION FOR
 COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOSTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/448,606
FILLING DATE: 25-AUG-1995
CINSETETATION.
 CORRESPONDENCE ADDRESS:
ADDRESSE: Pollock, Vande Sande & Priddy
STREET: 1990 M Street, N.W., Suite 800
CITY: Washington
STATE: D.C.
 TITLE OF INVENTION: Expression System For Producing

 The sequence encodes Granny Smith apple MdPI. The invention concerns a fruiting plant that has been genetically modified so that it does not concerns a functionally express the MdPI or MdAP3 peptide, producing seedless continuits. The DNA constructs encoding non-functional variants of MdPI/MdAP3 may be used to transform fruiting plants, specifically apple and pear. The polynuclectides may be used in modulating, reducing or eliminating seedless truiting plants, used in horticulture, and in breeding programmes to monitor the progress in breeding a stable seedless fruiting plant. The polynuclectides may also be used in programmes for contentifying nucleic acid variants from fruiting plants. They can be used for pre-selecting plants (mutated in MdPI, MdAP3 or their equivalents), for use in an accelerated breeding programme to produce seedless fruit. They may also be used in designing probes and primers for MdPI or MdAP3, or their variants. The seedless fruiting plant is more convenient than seeded fruit since these can be cropped without pollination, reducing the absence of pollen is also advantageous to alleviate environmental concerns regarding the transfer of transgenes to non-transgenics by cross pollination. Seedless cultivars can also avoid or reduce biennial bearing tendencies that have been attributed to the inhibition of flower bud formation by developing seeds and are less susceptible to codling moth compared to seeded fruit. (Updated on 11-SEP-2003 to standardise OS

 CC genetic sequence, which comprises a single-stranded oligonucleotide
CC having a DNA domain. The DNA domain has at least one mismatch with
CC respect to the genetic sequence to be altered and further comprises
CC chemical modifications of the oligonucleotide. The chemical modifications
CC consist of o-methyl modification, an LNA modification, two or more
CC phosphorothioate linkages on a terminus, or a combination of any two or
CC directing repair or alteration of plant genetic information. The
CC oligonucleotides are particularly useful for creating plants with desired
CC phenotypes, e.g. environmental or abiotic stress tolerance, improved or
CC conferring amino acid over production), herbicide resistance (e.g.
CC glyphosate resistance, inidazolinone and sulphonylurea herbicide
CC disease resistance, modified oil production, modified starch production
CC (e.g. increased starch or production of waxy starch), altered floral
CC (e.g. reduced palmitate, increased starate or reduced linolenic acid).
CC (e.g. reduced palmitate, increased starate or reduced linolenic acid).
CC (e.g. reduced palmitate, increased starate or reduced linolenic acid).
CC (analysis of photosynthetic processes. This sequence represents a genome
CC altering oligonucleotide of the invention

 This sequence encodes the rat glucocorticoid modulating element binding cc protein, GMEB-2, of the invention. The polypeptides interact with a GME cc (glucocorticoid modulatory element), linked to a nucleic acid sequence, cc resulting in increased expression of the nucleic acid sequence. The cc polypeptides may be supplied as such or provided by expression of the cc nucleic acid sequences, particularly to treat cells that do not produce cs sufficient, or functional, GME-binding protein. The nucleic acid sequences and the polypeptides of the invention can also be used to corresponding genomic sequence. The polypeptides may be used in two-cc nucleic acid sequences are useful as primers and probes to isolate the cc corresponding genomic sequence. The polypeptides may be used in two-cc plucocorticoid receptor (GR) dose-response curve. The polypeptides bind to dome. Proteins involved in modulating the cc glucocorticoid responsive element). This results in increased expression cof the GRE-regulated gene (which may be endogenous or introduced by gene cutherapy) in presence of physiological levels of a glucocorticoid hormone

 binds to the protein, and a biochip comprising CA nucleic acid or C fragments thereof. The sequences of the invention were identified using CC oncogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host concogenes. The CA nucleic acid sequences can be used to diagnose controloma (especially breast cancer, prostate cancer, lymphoma or letkaemia) or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as therapeutic agents and in screening and evaluating drug candidates. The present sequence represents a specifically claimed murine CA nucleic acid sequence of the invention. Note: The complete sequence data for this patent did not form part of the printed specification, but was obtained in which interestly from WIPO at

 The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinoma-associated (CA) genes from the 50 tables given in the specification. The CA proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADC85215-

The invention relates to Arabidopsis thaliana nucleic acid sequences. The invention related serve they encode are useful for identifying homologous or related genes, for producing compositions that modulate the expression or function of the polypeptides, for mapping functional regions of the protein, in diagnosis, for studying associated physiological pathways, for genetic manipulation of cells, preferably plant cells, in screening assays of various plant strains to determine the strains that are capable of withstanding a particular disease or environmental stress, for enhancing or inhibiting production of biosynthetic products in plants and to create generically modified and transgenic organisms, such as plant cells and plants. Transgenic plants are useful for introducing or improving disease resistance and stress

 Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov Series: IRAK Plate: 95 Row: C Column: 2
This clone was selected for full length sequencing because it passed the following selection criteria: Similarity but not identity to protein.
 Steven Jones, Jennifer Asano, Ian Bosdet, Yaron Butterfield, Susanna Chan, Readman Chiu, Chris Fjell, Erin Garland, Ran Guin, Lettlicia Hsiao, Martin Krzywinski, Reta Kutsche, Oliver Lee, Soo Sen Lee, Victor Ling, Carrie Mathewson, Candice McLeavy, Steven Ness, Pawan Pandoh, Anna-Liisa Prabhu, Parvanch Saeedi, Jacqueline Schein, Duane Smailus, Michael Smith, Lorraine Spence, Jeff Stott, Michael Thorne, Miranada Tsai, Natasja van den Bosch, Jill Vardy, George Yang, Scott Zuyderduyn, Marco Marra.

 /Clone lib="Cabernet Sauvignon Flower Pre-bloom - CAB1"
/note="Organ: Flower - Pre-bloom; Vector: pDNR; Site 1:
Sfil; Site 2: Sfil; CAB1 is a cDNA library of Vitis
vinifera cv. 'Cabernet Sauvignon' Clone 8 flowers. Samples
were collected approximately eleven days before onset of
bloom (clusters at this stage were fully developed and
flowers with calyptras or caps still attached. Sampled
vines were located at the University of California, Davis,
Experimental Vineyard. cDNAs were made by oligo-dT priming
and directionally cloned. 5'and 3' adaptors were used in
cloning as follows:
5'-AACCAGTGGTATCAACGCAAGTGGCCATTACGGCCGGG-3' and
5'-AACCAGTGGTATCAACGCAGAGTGGCCATTACGGCCGGG-3' and
STOTAGAGGCCGAGGGGGCGACATG-dT(30)NN-3'. Library was
constructed using the Clontech Creator SMART kit and
size-selected to contain the 0.5-3 kb size fraction."

 Conservative
 Separate cDNAs were generated using primers that incorporated unique 5' and 3' tags to distinguish each source of RNA. cDNAs were then pooled, size-fractionated, directionally cloned into a custom medium-copy vector and transformations made with four size classes to minimize size bias. Details of each source of RNA and library construction can be obtained at http://cgpdb.ucdavis.edu/TAG_LIB-QG_EFGHJ lettuce serriola
 /clone_lib="QG_EFGHJ lettuce serriola"
/note="Vector: pBRcDNASfiAB; The library was constructed
from 10 different sources of RNA from a single genotype.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 1, Application US/09410464

Patent No. 635892

GENERAL INFORMATION:

APPLICANT: Streams et al.

TITLE OF INVENTION: Floral homeotic genes for manipulation of flowering in TITLE OF INVENTION: Poplar and other plant species.

FILE REFERENCE: 53375

CURRENT APPLICATION NUMBER: US/09/410,464

CURRENT FILING DATE: 1999-10-01

EARLIER APPLICATION NUMBER: 09/287,700

EARLIER APPLICATION NUMBER: 09/287,700

EARLIER APPLICATION NUMBER: 60/080,851

EARLIER PILING DATE: 1998-04-06

YUMBER OF SEQ ID NOS: 24

SOFTWARE: Patentin Ver. 2.0
